## \* Class vs ID :->

- Id is something that is unique. We use '#' to define it or to style that id.
- One element can have only one id and not more than that.

Whereas,

Class is an attribute used to define a group of HTML elements in order to apply unique styling or formatting to those elements of CSS.

- We can have multiple elements in a class.
- We use '.' to select elements with a specific class attribute.

Ex ->

```
• intro  
  {  
    color: #black;  
  }
```

<p class="intro"> Hie </p>

Ex ->

```
#intro  
{  
  color: #black;  
}
```

<p id="intro">  
 Hie </p>

Date:

I<sup>st</sup> class 2<sup>nd</sup> class

\* But this can't be done with id.

What we can have is  $\rightarrow$

`<p id="copy" class="intro para"> -- --</p>`

We can have id as well as class inside a single element.

→ So, when we apply styling to the particular id and classname, the styling which was given to the id will be reflected on the page.

\* Summary for Class vs Id →

- 1) Id is unique, an id can appear only once on the page.
- 2) An element can have only one id.
- 3) Classes need not be unique.
- 4) One class can be used by multiple elements and multiple elements can have same class.
- 5) You can have id and class both for a element.
