

4|2)

## \* Image & Lists →

→ Two ways of inserting image...

(1) ``

(2) ``

## \* List

(1) Ordered List → There will be numbers provided, or alphabetically.

<ol>

<li> item 1 </li>  
<li> item 2 </li>

O/P → 1. item 1

2. item 2

</ol>

(2) Unordered List → Provides bullets, squares etc.. on the content of the list.

<ul>

<li> Item 1 </li>  
<li> Item 2 </li>

</ul>

→ To change styling we use type attribute inside the <ol> and <ul> tags.

Ex → ① <ol type="a">  
type = "A"  
type = "i"  
type = "I"

② <ul type="circle">  
type = "square"  
type = "disc">

col start = 4 reversed = True?

O/P → 4. —  
3. —  
2. —  
1. —

## \* form & links →

→ for links we use,

```
<a href = "Contact.html"></a>
```

→ We use them, to redirect the user to a new page or to a link for some other website ...

→ Forms → `<form action = " — .html" method = "GET">`

When we use 'GET' the data passed can be seen in the URL.

and when we use 'POST' the data is passed in the body and is not visible in the URL.

→ In form, we can do this one more thing  
that is →

while defining label and input,

```
{ <label for = "name"> Name </label>  
<input name = "name" id = "name" type = "text" > }
```

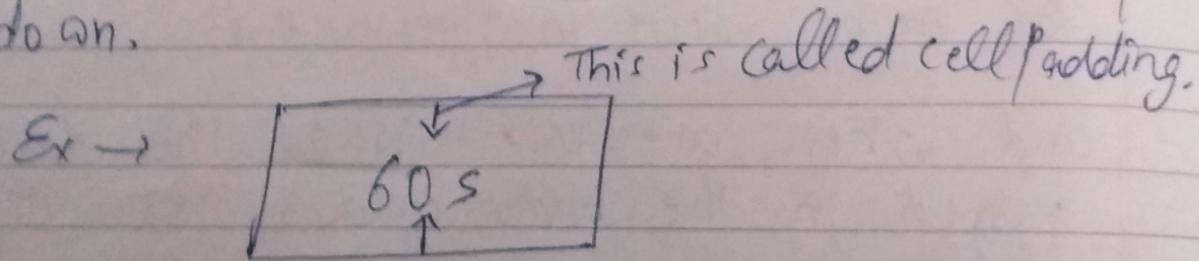

if we want them to relate them with another we can do it with the help of "for" in label and "id" in input.

\* Tables →

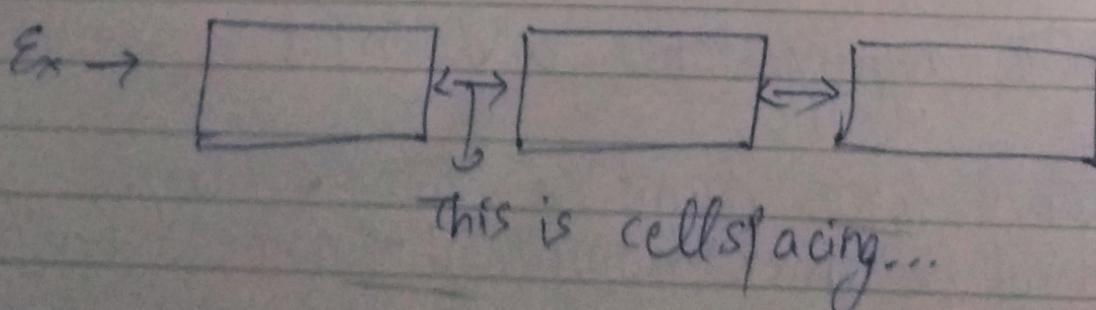

```
<table>
<thead>
<tr>
<td>
<th>
<tbody>
<tfoot>
```

→ attributes → bgColor, align, border, cellpadding, cellspacing..., width..

\* Cellpadding → It decides the distance b/w the content and the border up side down.

\* Cellspacing → Provides spacing b/w individual cells.

Colspan →

if Colspan = 3  
if merges the 3 columns - Horizontal

\* In order to merge cells vertically or  
use rowspan.  
i.e., rowspan = "2".
