

Bootstrap

* Introduction → It is one of the most popular framework for building responsive, mobile-first sites with Bootstrap CDN and a template starter page.

[Website → "www.getbootstrap.com"]

→ CDN stands for → Content Delivery Network

In CDN code will be hosted in different machines and code will be stored somewhere if I want to access that particular code and to reduce the delay we use CDN. It will look for the nearest machine out there once the link is been clicked in order to reduce the time. Due to the multiple copies present all over the internet the chance of failure is very less.

* How - To Use → By simply including the CSS and javascript / jquery links from the website in our code.

→ Once included we just have to use the appropriate classes so that our bootstrap code can work the way we want it to work.

*

Bootstrap - Texts → Done with Practicing
it in visual code
Studio.
