* Handling 404 - Page not found...

→ As previously we have seen that how we define route for a component.

→ What if I don't want the route to display the whole component we just want something very simple to be displayed on screen.

Ex →

```
<switch>

<Route path = "/about" render = {
                () => <h3> About Us
                        </h3> }/>

</switch>  }
```

→ Now we also have one another easy concept, when we visit a website we sometimes see a message like →
                "Page Not found".

→ So, how it happens and why we see that thing.

→ So, if the user enters a url which doesn't exists for our webpage so in order to handle it we show them the '404- Page Not found' Error.

So, we go ahead and write →

`<switch>`

`<Route path = "/about" Component = {about} />`
`<_____ " _____ />`

| and at last |

we write.

`<Route Component = {Page Not Found} />`

`</switch>`
